

KATHREIN

Tag Blower: license for one RFID reader

The TagBlower software application significantly reduces network traffic between the Kathrein RFID reader and the central enterprise system. The reader does not send all RFID tags in range to the system (hundreds of codes per second!), but only changes in their visibility. At the same time, each data sent can contain a pre-set message (e.g. Tag has appeared / It is getting closer / The tag is moving away).

The TagBlower app is a simple application that makes it possible to distribute data quickly in a defined way. The data read are stored automatically at a predefined port and can be accessed and picked up by an external listener. In addition to the data read, status messages (e.g. "Transponder approaching") can also be issued. This range of data and status messages can be customized. Data can therefore be captured in simple applications or early in the realization phase.

Advantages of the TagBlower application

- Multiple listeners
- Push notifications
- Configurable
